

Whitepaper version 1.0

Read this whitepaper to see that Buzz Reward is not actually a coin meme but a far more forward-looking project.

What is Buzz, then?

Buzz was born as a coin meme but its real goal is to create value in the real economy.

The choice to create a meme coin in the initial phase is one of the attempts adopted in the design phase that aim to prevent that after the launch the initial investors can sell at a loss as happens in almost all the pre-sales of the city projects, Other actions have been designed and will be taken after pre-sales to ensure maximum efforts to protect initial investors.

The development of the project needs a good user base, we are talking about small investors who believe in the idea of the project and who do not invest their money only for temporary profits due to the market pumps.

Buzz was born as a meme coin with low capitalization just to reach a large number of small investors who can buy a small share of tokens and keep it actively participating in the community and helping to make a fortune your investment.

To understand the idea behind the project we must start step by step and more precisely from a basic principle.

What gives value to a currency?

Why should 1 dollar or 1 euro allow us to buy 1 kg of flour while a generic token just created on the blockchain not? The answer is simple and I think you all know, what gives value to currencies we all are, the fact that we all agree to exchange them for our goods, our time, our work performance.

So what is it that really matters, the currency or the efforts we make to get it?

What does the printed paper that we call currency really value and that we pursue with all our efforts for life or the services, the works, the goods that we can produce with our physical and mental efforts?

Logically, the real value lies in the value that we can create, not in a piece of paper printed on the bottom.

If we were on a deserted island we would certainly prefer a fishing rod or an axe to a suitcase full of dollars.

We live in a society in which those who have money have opportunities, regardless of their abilities, skills or efforts that each of us can make to move to a better quality of life.

Possibility Ec *Whitepaper version 1.0*

The current economic model always tends to benefit those who choose to take shortcuts, even if morally and ethically questionable and instead makes difficult the path of those who work, produce and never stop improving.

Globalisation, international monetary policies, the recent pandemic, but also the giant steps made by the technology and telecommunications sector have led over the decades to the reduction of jobs and an impoverishment of the middle class that is increasingly disappearing.

In the current economic system, there is no mechanism for redeploying workers who are made redundant when there is a technological innovation or a crisis in the sector. So when a job is no longer needed the worker simply remains unemployed and without income.

It would be necessary and urgent to introduce mechanisms for the redistribution of wealth, such as the continuous search for the reintegration of the unemployed but also more simply a redistribution of working hours in times of crisis.

To better understand, let's think about a company that produces cars, if this company goes through a period in which there is so much demand, how will it manage the increase in production??

It will certainly resort to overtime work that will increase the ability to produce cars.

And if the strong peaks of work are managed with overtime, **why should not a period** of crisis be faced with the reduction of the daily working hours of all employees and not with the dismissal of a part of the workers?

Today, many people are unemployed and cannot produce value simply because we are in a period of economic crisis.

In other words, there is no money in circulation, the circulation of the piece of paper has decreased and people cannot take advantage of the services they need and which perhaps are provided by workers who are unemployed.

Yet each of us may need advice, a bed or any other good or service that we cannot buy because the piece of paper has stopped circulating.

What should be a tool for allowing the exchange of goods and services has become an obstacle to economic activity, preventing people from creating value and exchanging it freely.

What is really missing in times of crisis are not real goods but the tool to exchange them, and therefore the farmer does not cultivate the land because there is no money to pay for his work and the craftsman does not produce his shoes for the same reason, Neither will produce value and in the end there will be neither vegetables nor shoes for both. Barter though it is a very primitive exchange system is much more efficient than this disastrous economic system.

Possibility Ec *Whitepaper version 1.0*

And if so far we have said that currencies are a simple means of exchange united simply by the fact that they are widely accepted among the population, why not try to build an economy in which the currency plays the role for which it was born?

Must the means of exchange really be scarce and represent an obstacle to the well-being of individuals or can it safely carry out its function by circulating in abundance?

The idea behind the project aims to solve this very problem, create a large community that is aware that the true god is not money but the real value that we can produce when each of us uses our own efforts and skills and makes them available to the community, knowing that they can also count on the value made available by others.

To better understand the concept, let's try to imagine 2 islands scattered in the ocean and thousands of miles away from each other. In both islands the population will have to be self-sufficient because it cannot have contact with the outside.

Which of the 2 do you think can thrive, the one where the population is rich in farmers and artisans or the one where the population consists of politicians and bankers?

The Ecosystem we are going to create aims to improve the quality of life of all of us. We can do something for others and in return get tokens that we can use in exchange for services offered by users of our community.

The token would allow the exchange (barter) what we can offer the community in exchange for what the community can offer us.

Let's talk about exchange of real value, not tokens, the token is just the tool, the focus is always and only on the real value.

I could earn my tokens by doing something useful for the community, for example by being a moderator in the telegram group or by making translations useful for the dissemination of the project or by working on the improvement of the website and buying with the same tokens goods and services offered by other users.

Someone could sell their work performance or products on the platform and receive in return tokens needed to purchase other goods or services.

What needs to be clear is simply the fact that tokens are like any fiat currency "a simple exchange **tool**", they are only "**a means**" and have no intrinsic value like the dollar or the euro does not.

Therefore the exchange of services and performances will happen through the exchange of the token, this is by now clear.

Now let's go back to thinking about fiat currencies in order to introduce the second problem to be managed in order for the project to be successful.

Possibility Ec *Whitepaper version 1.0*

What's wrong with fiat currencies?

Their main problem is centralization, their issuance is managed by subjects who, while assuming that they manage in good faith, can vary the amount in circulation, conveying through various political maneuvers abundance or scarcity.

Bitcoin has had this great success precisely because it has allowed to overcome the limit of the centralization of power. People have been able to trust that the blockchain will not be tampered with and have slowly started to value it, to bring it to today's prices.

Bitcoin has become an excellent store of value in recent years, but despite this has also not allowed a redistribution of wealth.

This is because it was immediately exchangeable on the market with dollar and other currencies.

This simply means that those who have dollars or euros or plenty of other fiat currencies can have bitcoins, those who do not have them does not even Bitcoin, poor was, poor is and unfortunately poor will remain.

If any coin is listed on dex and cex exchanges and has a solid project and a good community will be purchased immediately by large investors (whale) which will have a great influence on the market price and will be able to bring down the price at any time destabilizing the project.

For this reason, the Buzz token (whose utilities we will go into in a dedicated paragraph) will be accompanied by a second token, Possibility **\$Pos**, which will have the function of ensuring the free movement of goods and services in the community.

\$Pos can be earned by performing community-wide activities and trading members in exchange for performance.

The token will be distributed without any money transfer because the goal is to generate real value.

For this reason **\$Pos** will never be listed on a market, we talked earlier about bitcoins just to focus attention on why it will never lead to a redistribution of wealth. If a token is listed on the market it is easier to manipulate and destabilize its operation. It will be possible to get **\$Pos** only by creating real value, who will produce real value can get **\$Pos** in return, there will be no other ways, it will not be available on any exchange until we have a sufficiently large community and a good distribution of the token.

\$Pos will be exchanged on Dex and Cex when it happens naturally, that is when the quotes will be opened directly from the exchanges, at which point it will come only building a large community.

Possibility Ec *Whitepaper version 1.0*

The real wealth and strength of a project is given by the number of users who share the same ideas and if we are large enough we could get to negotiate our token almost anywhere and we can create partnerships with large communities both around the world crypto that outside of it.

Imagine how much value we can generate if hundreds or thousands of users will start contributing to the project by investing real value, that is, time skills ideas visions etc.

Imagine how many big companies might be tempted to accept even partial payments of their products with our token if they know that behind the project there is a community (in their eyes a large market) of hundreds of thousands of users.

Cryptocurrencies are characterized by high volatility precisely because their value is often devoid of underlying, is given by the fomo, the trend of the moment.

But what happens when a cryptocurrency is no longer fashionable? its value deflates and who arrived first and has the cunning to get out in time realizes the profits, the last arrivals have only big losses.

And this happens precisely because in most cases cryptocurrencies are devoid of real value.

Today 99% of crypto projects are pure junk created to deceive investors with promises of great returns. Projects destined to last a few months, just the time to rob the poor investors who lose time and money.

The crypto world is unfortunately a painful environment in which fraudsters and dishonests abound.

The goal of Possibility is to create something different by exploiting the potential offered by blockchain but keeping us away from those that are the classic crypto projects.

Our effort will be mainly focused on creating a large community that shares the basic ideas of the project, in this way the sum of our small efforts will give an immense value to the project and its participants.

So the goal is to create real value in the community before you even think about a token value, which will be the greater the ability to generate real value.

For this reason the Possibility **\$Pos** token will not be offered for sale but simply earned by actively participating in the community, helping the project in creating an economy that will generate well-being for all participants. The ecosystem will therefore consist of 2 tokens, Buzz that will do the dirty initial work and **\$Pos** that will be used in the community

Possibility Ec *Whitepaper version 1.0*

for the exchange of goods and services and for the remuneration of active users that will contribute to the development of the ecosystem.

When the distribution of Possibility is fairly widespread the contract will be waived and the ecosystem can continue on its own without the need to have a command team.

The owners of Buzz, as co-founders and initial funders of the project will have voting rights in the community and will have a perpetual income in **\$Pos**. The income owed to the owners of Buzz will be the greater the tokens held.

The basic idea is to reward the first 200 holders by dividing them into 4 categories according to the amount of tokens held:

Here are the annuities designed for the first 200 holders of **\$Buzz**

From 1 to 50 will have an income of \$5,000 **\$Pos** month

From 51 to 100 will be entitled to an income of \$3,000 **\$Pos**

101 to 151 will be entitled to an annuity of \$1,500 **\$Pos**

From 151 to 200 will be entitled to an income of \$1,000 **\$Pos**

To do that we'll need to develop a contract that tracks Buzz's owners and generates rewards.

Both tokens will be waived as soon as there is a good user base.

This document is the first step to share the ideas that have given rise to this project. So much work will be necessary to achieve the main goal:

Create a true decentralized economy based on value within which no one can take dominant positions or accumulate wealth at the expense of others.

An economy without banks and politicians who profit from the work of the population. There will be many efforts to be made and probably many mistakes to be corrected, we will have to work on the design and creation of a platform on which all exchanges will take place, create a statute as detailed as possible to regulate and avoid any possible dispute between users, strive for the dissemination of the project, identifying any critical points that need to be addressed and resolved.

It won't be easy but what we can do with **unity and shared efforts** has no limits.

tokens not distributed in the different phases will be burned or not minted

1 Reward to holder and community member 30.000.000 \$Buzz

The most important wallet of the project is undoubtedly number 1.

This wallet contains tokens that are intended to support initial investors in the event of token depreciation. The initial phases of a project are always the most delicate for investors and every good investor knows that the choice of the moment of entry is crucial for a good return on an investment.

If we put aside scam projects, which lose value in the post-pre-sale phase due to malicious actions undertaken by the team itself, even in projects led by a loyal development team the

Possibility Ec *Whitepaper version 1.0*

pre-sale phase is a very delicate moment. Investors are often in a hurry to get a return and are led to sell at the first increases; the fear that large holders may exit the project or even partially sell their shares generates moments of panic which lead to great price volatility and sales which almost always work to the detriment of less experienced investors.

The function of this wallet is precisely to guarantee initial investors by supporting them in times of token depreciation. By doing so we will be able to support those who decide to finance the project with free tokens in order to guarantee the value of their investment.

Our advice is to invest small sums to avoid being emotionally compromised and to actively dedicate yourself to the community which is the true value of this project.

The tokens of this wallet will only be sent to addresses that only have buy transactions, so our advice is to invest small sums without ever selling rather than buy large quantities of tokens and then being forced to sell.

No free tokens will be sent to wallets that have sell transactions.

This mechanism should be able to guarantee investors and leave the team free to develop without other worries.

2 Marketing and Development 10.000.000 \$Buzz

This wallet contains the tokens intended to finance the development and marketing of the project.

This wallet also contains the share of tokens reserved for the team which is equal to 5% of the total tokens.

We are quite confident that if we can build a good community there will be no need for this wallet in the future and we will be able to burn most of the tokens.

3 Airdrop wallet 10.000.000 \$Buzz

The airdrop wallet contains the tokens intended for the various airdrop phases. We decided to give away part of the tokens for free for 2 main reasons:

1. Expand the number of owners, consequently increasing the community;
2. Exploit the benefits in terms of marketing given by the actions that users must perform to receive the airdrop.

We have planned several airdrop phases to be able to take advantage of this free marketing, at the end of these phases the remaining tokens will be burned.

4 Cex/Dex listing

This wallet contains the tokens necessary for DEX and CEX quotes.

COMMUNITY RULES Version 1.0 of 10/22/2023

If you are not new to the crypto world you will surely know how important the community is for a project, many developers talk about the power of the community but then create empty communities with Telegram groups made up of robots or fake users purchased for a few dollars online.

Those who have the patience, strength and spirit of sacrifice to stay with us will understand the power of the community we are creating.

But what really is a community? The word “Community” itself describes a group of users who are linked together by common interests and who for this reason move together to achieve a common goal.

Now stop and think for a moment and try to find 10 communities in any sector that deserve this name. **Very difficult right?**

This is because the word community is often used too easily.

In order for a group to be called a community it must be linked by common interests and must move together towards achieving objectives that lead to common well-being, it is not enough to be registered in the same Telegram group.

We often see in the Telegram groups of various projects a number of users that reaches even thousands of people, **but do you have any idea of what even just 100 users who are linked together by a common purpose can achieve if they start fighting to achieve it?**

What we are going to create here will be a real community made up of users aware of the fact that only with union is it possible to generate value and wealth for everyone, each of us must make our own small effort for the common well-being and the results will be great.

We will not accept into our group users who do not participate in our efforts and for this reason inactive users will be automatically eliminated from the group, losing their seniority of membership in the community and the benefits that derive from it.

Users in the group who remain inactive for more than 30 days will be automatically deleted.

Why do we do this? The seniority of membership in the community will be the reason for various rewards in the future and we think it is right that these rewards go to users who have truly participated in the efforts made by our community.

A series of activities that aim to strengthen our army will be designed and updated in this document. Participating in these activities will allow users to earn **\$Buzz rewards**.

It will therefore be possible to obtain **\$Buzz** in 2 ways:

- 1 Buy tokens from the website **www.buzzreward.xyz** financing the marketing of the project;
- 2 By becoming an active member of our community and helping us build our future.

We are very confident that we can take this project beyond even the most optimistic imagination.
